Cutter	Scrapper	Felt edge squeegee	Sprayer	Squeegee	Product ref : **KITbat**

1 Clean your glass windows perfectly

Spray the glazing with soapy water and scrape off any impurities. Add more soapy water and wipe off any remaining residue with a window scraper. Dry with a clean, dry cloth.

i *Clean the frames too*

2 Remove the film's protective liner

Use 2 pieces of tape (not supplied) placed at an angle opposite each other to separate the 2 parts. While carefully removing the protective film, spray the adhesive side with plenty of clean water.

i *The side of the protective film is indicated by a coloured dot.*

3 Place the film

Take care to apply the wet side against the glass, taking it from the top.
Slide it over the glass to position it at an angle and start smoothing it by hand.

i *Once the film is in place, spray with water to make the clump slide.*

4 Stamp the film

Smooth the film using the Felt edge squeegee from the centre outwards, starting at the top.

5 Redécoupez si nécessaire

Use the Felt edge squeegee to guide the cutter as you cut so that it no longer touches the frame, then press down again.

👍 **The installation is complete !**
